☐ 1: Peptide-N4-(N-acetyl-beta-glucosaminyl) Asparagine Amidase [Links](#)

An amidohydrolase that removes intact asparagine-linked oligosaccharide chains from glycoproteins. It requires the presence of more than two amino-acid residues in the substrate for activity. This enzyme was previously listed as EC 3.2.2.18.

Year introduced: 2004

Subheadings: This list includes those paired at least once with this heading in MEDLINE and may not reflect current rules for allowable combinations.
